

**AMENDMENTS TO THE CLAIMS**

Please amend the claims as indicated below. The language being added is underlined ("\_\_\_") and the language being deleted contains strikethrough ("—"):

---

1. (Currently Amended) A system for processing reservations, comprising:  
a reservation processing unit located at a retail location and configured to track  
and process customer reservations;  
receiving means for receiving data transmitted via a electromagnetic waves, the  
receiving means being operatively disposed with the reservation processing unit; and  
a remote access unit having a memory configured to store customer identification  
information and a low-power transmitter adapted to transmit the customer identification  
information to the receiving means, the remote access unit further having a manually-operated  
transmit button and a controller, responsive to the transmit button, to controllably retrieve  
customer identification information from the memory and transmit the customer identification  
information from the low-power transmitter.

2. (Original) The system as defined in claim 1, wherein the receiving means  
receives electromagnetic data in a wavelength selected from the group consisting of:  
radio frequency;  
ultrasonic; and  
infra-red.

3. (Original) The system as defined in claim 1, wherein electronic circuitry that carries out the functionality of the remote access unit is contained within a single integrated circuit.

4. (Original) The system as defined in claim 1, wherein the remote access unit includes means for formatting the customer identification information into a data packet for transmission to the receiving means.

5. (Original) The system as defined in claim 1, wherein the remote access unit further includes a second transmit button.

6. (Original) The system as defined in claim 1, wherein the reservation processing unit further includes a network link configured to provide internet access.

7. (Currently Amended) A method for processing reservations comprising the steps of:

receiving a transmitted electromagnetic signal including customer identification information at a receiver located at a retail location;

retrieving the customer identification information from the transmitted electromagnetic signal;

updating reservation information using the customer identification information;

and

providing a notification that the customer is about to arrive.

8. (Original) The method as claimed in claim 7, further comprising the step of receiving a reservation over an internet connection.

9. (Original) The method as claimed in claim 7, further comprising the step of displaying the updated reservation information.

10. (Original) The method as claimed in claim 7, wherein the step of receiving a transmitted electromagnetic signal further comprises receiving a low-power radio frequency signal.

11. (Original) The method as claimed in claim 7, wherein the transmitted electromagnetic signal is generated by depressing a manually-operative transmit button of a remote access unit.

12. (Original) The method as claimed in claim 11, wherein the customer identification information is retrieved from an internal memory of the remote access unit.

13. (Original) The method as claimed in claim 12, wherein the retrieved customer identification information is formatted into a predefined signal prior to transmission.

14. (Currently Amended) A system for remotely processing reservations, comprising:

a reservation processing unit located at a retail location, configured to receive customer identification information from a remote access unit having a memory configured to store customer identification information and a low-power transmitter adapted to transmit the customer identification information, the remote access unit further having a manually-operated transmit button and a controller responsive to the transmit button to controllably retrieve customer identification information from the memory and transmit the customer identification information from the low-power transmitter; and

receiving means associated with the reservation processing unit for receiving data transmitted via a electromagnetic waves.

15. (Currently Amended) A computer readable storage medium containing program code for controlling the operation of a system for providing remote processing of reservations, the system comprising:

Handwritten: *AK*

a reservation processing unit located at a retail location;

receiving means for receiving data transmitted via a electromagnetic waves; and

a remote access unit having a memory configured to store customer identification information and a low-power transmitter adapted to transmit the customer identification information to the receiving means, the remote access unit further having a manually-operated transmit button and a controller, responsive to the transmit button, to controllably retrieve customer identification information from the memory and transmit the customer identification information from the low-power transmitter.
